

METHOD OF DYNAMIC RATE SPLITTING

ABSTRACT

A method of wireless communication. The method may involve a number of multicast service subscribers. In one embodiment, the method includes assigning at least one multicast rate to each multicast service subscriber. The assigned multicast rate, by this method, corresponds with determining channel conditions, power requirements, desired content and/or the multicast service subscription type for each subscriber. In another embodiment, the method includes receiving a multicast subscription service at an assigned multicast rate. The assigned multicast rate here corresponds with the multicast subscription type, desired content, channel conditions, power requirements, other services and/or equipment class of the user.
